"Functional characterization of two splice variants of rat BAD and their interaction with Bc1-w in sympathetic neurons.";

Wol. Cell. Neurosci. 17:97-106(2001).

C -!- FUNCTION: Promotes cell death. Successfully competes for the binding to Bc1-x(L), Bc1-2 and Bc1-w, thereby affecting the level of heterodimerization of these proteins with BAX. Can reverse the death repressor activity of Bc1-x(L), but not that of Bc1-2 (By similarity). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

C :- SUBUNIT: Forms heterodimers with the anti-apoptotic proteins, Bc1-2 (N), Bc1-2 and Bc1-w. Also binds protein $100A10. The Ser-113/Ser-137 phosphorylated form binds 14-3-3 proteins.

C :- SUBCELLULAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm (By similarity).

C :- ALTERNATIVE PRODUCTS: 2 isoforms; alpha (shown here) and beta; are produced by alternative splicing. They differ only in their C-terminal regions.

C :- TISSUE SPECIFICITY: Expressed in all tissues tested, including brain, liver, spleen and heart. In the brain, restricted to epithelial cells of the choroid plexus. Isoform alpha is the more

Fesik S.W.;

Frationale for Bcl-xL/Bad peptide complex formation from structure, mutagenesis, and biophysical studies.";

Protein Sci. 9:2528-2534(2000).

FUNCTION: Promotes cell death. Successfully competes for the binding to Bcl-x(L), Bcl-2 and Bcl-w, thereby affecting the level of heterodimerization of these proteins with BAX. Can reverse the death repressor activity of Bcl-x(L), but not that of Bcl-2 (By similarity). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

Forms heterodimers with the anti-apoptotic proteins, Bcl-1 Sumilarity). Bcl-2 and Bcl-w. Also binds protein $100A10 (By similarity). The Ser-75/Ser-99 phosphorylated form binds 14-3-3 proteins (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              16-OCT-2001 (Rel. 40, Last sequence update)
01-MAR-2002 (Rel. 41, Last annotation update)
BC12-antagonist of cell death (BAD) (BC1-2 b
6) (BC1-XL/BC1-2 associated death promoter).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ottilie S., Diaz J.-L., Horne W., Chang J., v

Subsequent phosphorylation on Ser-99 promotes heterodimerizatival 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-118, a site within the BH3 domain, lead to the release of Bcl-x(L) and the promotion of cell survival. Ser-99 is the major site of AKT/PKB phosphorylation, Ser-118 t major site of protein kinase A (CAPK) phosphorylation (by similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SIMILARITY: CONTAINS 1 BCL-3 HOMOLOGY DOMAIN 3 (BH3). 1. COFACTOR: Pyridoxal phosphate.

1. ENZYME REGULATION: Allosterically activated up to 20-fold by S-adenosyl-methionine (SAM).

1. PATHWAY: Threonine biosynthesis; last step.

1. SUBUNIT: Homodimer.

1. SUBCELLULAR LOCATION: Chloroplast.

1. SIMILARITY: BELONGS TO THE SERINE/THREONINE DEHYDRATASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nelson J., Spieth J., Ryan E., Andrews S., Geisel C., Layman D., Du H., Ali J., Berghoff A., Jones K., Drone K., Cotton M., Joshu Antonoiu B., Zidanic M., Strong C., Sun H., Lamar B., Yordan C., Antonoiu B., Zidanic M., Strong C., Shekher M., Matero A., Shah Swaby I.K., O'Shaughnessy A., Rodriguez M., Hoffman J., Till S., Granat S., Shohdy N., Hasegawa A., Hameed A., Lodhi M., Johnson Chen E., Marra M., Martienssen R., McComble W.R.;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the European Bioinformatics Institute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC (R-X)n-peptide where n = 1-10; X = C-0, when the R-X group is attached CC to the N-terminus of the peptide, or a side chain of the peptide where CC the functional group of the side chain of the peptide or the functional group of the side chain in the N-terminus of the peptide, or a side chain functional group is attached to the C-terminus of the peptide, or a collection of the peptide, where the side chain functional group is COOH CC or two double bonds, cyclobutyl or alkoxy, 2-14C alkylenyl optionally containing one CC phonyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides AAB3701-137058 represent analogues CC of the peptide portion of the conjugate. The peptides conjugate The peptides represent analogues CC of a mosubstituted with a gonist Bad. The peptide conjugate is CC useful for modulating apoptosis in the cell death agonist Bad. The peptide conjugate is CC useful for modulating apoptosis in the cell set a subject or treating a conjugate is useful for modulating apoptosis in the cell set a subject in the peptide conjugate is useful for treating a conjugate as The peptides of a subject afflicted with a cancer characterized by cancer cells that cancer includes prostate, colorectal, gastric, consmall lung, renal or thyrold cancers, neuroblastoma, melanoma, or conjugate is also useful for treating disorders, acquired to increased apoptosis, e.g. neurodegenerative disorders, acquired conjugate is end conjugate is also useful for treating disorders acquired by increased apoptosis, e.g. neurodegenerative disorders acquired because in the cell function. Set and set in the cell set in the cell set in the cells that conjugate is a sourcer cells that set in the cells of a subject in the cells that conjugate in the cells that conjugate is a set in the cell set in the cells that conjugate is a set in the cell set in the cells that conjugate is a set in the cell set in the cells that conjugate is a set in the cells that conjugate is a set in the cell set in the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Ma

The present sequence represents a human p15 BID polypeptide. p15 BID polypeptides have cell death agonist activity. Cell death mediated by tumour necrosis factor (TNF) and FAS signalling pathways includes the generation of p15 BID, which is translocated to the mitochondria where it exerts cell death agonist activity, probably by inducing release of cytochrome C. The p15 BID polypeptides are useful in methods for modulating death of a target cell. Mutants of p15 BID, comprising an inactivating mutation in the BH3 domain, are used in methods for inhibiting death of a target cell. Agents that specifically inhibit caspase cleavage of p22 BID at the p15 cleavage site are also useful for inhibiting death of a target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human and murine p15 BID polypeptides with cell death agonist activity are produced by caspase cleavage of BID in cells undergoing FAS or tumour necrosis mediated cell death, useful as modulators of target cell death -

⋗ Korsmeyer SJ;

Human and murine p15 BID polypeptides with cell death agonist activity are produced by caspase cleavage of BID in cells undergoing FAS or tumour necrosis mediated cell death, useful as modulators of target ce cell

27; Fig 2B; 55pp; English

The present sequence represents a variant of p15 BID polypeptide. p15 polypeptides have cell death agonist activity. Cell death mediated by tumour necrosis factor (TNF) and FAS signalling pathways includes the generation of p15 BID, which is translocated to the mitochondria where it exerts cell death agonist activity, probably by inducing release of BID

The p15 BID polypeptides are useful in methods for modulating death of a target cell. Mutants of p15 BID, comprising an inactivating mutation in the BH3 domain, are used in methods for inhibiting death of a target cell. Agents that specifically inhibit caspase cleavage of p22 BID at the p15 cleavage site are also useful for inhibiting death of a target cell.
The invention relates to a method for negative selection assay that comprises introducing a genetic library encoding putative cytotoxic agent into a population of target cells, plating the cells on a surface, collecting a subpopulation of the cells that disattach from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the surface for a period of time and recovering a first pool of genetic material from the subpopulation. The method is useful to identify cytostatic or cytotoxic agents that cause a lethal phenotype. The method is also useful to identify conditional cytotoxicity and cell specific cytotoxicity. The cytostatic or cytotoxic agents are useful in the treatment of cancer and other diseases involving abnormal cell proliferation. The present sequence is human pro-BID (BH3 Interacting Domain Death Agonist) protein. Peptide fragments of BID referred as clones #1 and #2 are identified as cytotoxic agents by negative selection of HT29 colon cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; BH3 interacting domain death agonist; BID; BCL-2 family; apoptosis; regulation; cell death; inflammation; cancer; arthritis; autoimmune disease; viral infection; lymphoproliferative.
The present sequence represents a BH3 interacting domain death agonist (BDD) protein given in the present invention. The protein, the DNA encoding it or antisense sequences can be used for preventing or treating a decreased apoptotic state of a cell. The decreased apoptotic state that is treated results from a disease such as cancer, viral infections, lymphoproliferative conditions, arthritis, inflammation and autoimmune diseases. Antibodies against the BHD protein can be used for detecting a BHD polypeptide in a cell or population of cell. The nucleic acid
                                                                                                                                                            \rm BH3 interacting domain death agonist polypeptide - used for treating decreased apoptotic conditions resulting from inflammation etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo

                                                                                                                                                                                                             This sequence represents the HIV-1 Tat 1 protein. The invention relates to a bcl homology domain 3 (BH3 domain), the invention relates to a bcl homology domain 3 (BH3 domain), derived from a propopotatic member of the BCL-2 family. The BH3 polypeptide can be used in a method for promoting apoptosis in a target cell, especially where the cell is a cancer cell a virus infected cell or an autoantibody producing cell. The BH3 polypeptide can be used in therapeutic compositions for treating disease including cancer, other lymphoproliferative conditions architics, inflammation, and autoimmune diseases, which may result from the down regulation of cell death
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequence and the BID protein can also be used for treating immunodeficiency disease (including AIDS), senescence, neurodegenerationsease, ischaemic and repetiusion cell death, infertility and vound-healing. Primers derived from the nucleic acid encoding the BID protein can be used for detecting/quantitating the protein and for detecting alterations in the nucleic acid encoding the BID protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     BH3 domain; cell death agonist; bcl homology domain; BCL-2 family; apoptosis promoter; cancer cell; virus infected cell; inflammation; autoantibody producing cell; cancer; lymphoproliferative condition; arthritis; autoimmune disease; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   27
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene 31 clone HLTBX31
```

New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders

This sequence represents a secreted human protein encoded by clone detailed in the descriptor line. The gene can be used fusion proteins by linking to the gene to a human immunoglobu

The invention relates to 87 novel genes and their fragments (nucleic acid sequences: AAX00511-X00724; amino acid sequences AAW67807-W68004) which are useful for preventing, treating or ameliorating medical conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 80 polynucleotides. Specific uses are described for each of the 81 polynucleotides. Specific uses are described for each of the 81 polynucleotides.
The present sequence represents a human BID polypeptide. The specification describes pl5 BID polypeptides which have cell death agonist activity. Cell death mediated by tumour necrosis factor (TNF) and FAS signalling pathways includes the generation of pl5 BID, which is translocated to the mitochondria where it exerts cell death agonist activity, probably by inducing release of cytochrome C. The pl5 BID
                                                                                                                                                                                                                                                     Human and murine p15 BID polypeptides with cell death agonist activity are produced by caspase cleavage of BID in cells undergoing FAS or tumour necrosis mediated cell death, useful as modulators of target cell death.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       19-AUG-1998;

The present sequence represents a BH3 interacting domain death agonist (BID) protein given in the present invention. The protein, the DNA encoding it or antisense sequences can be used for preventing or treating a decreased apoptotic state of a cell. The decreased apoptotic state that is treated results from a disease such as cancer, viral infections. Lymphoproliferative conditions, arthritis, inflammation and autoimmune diseases. Antibodies against the BID protein can be used for detecting a BID polypeptide in a cell or population of cell. The nucleic acid sequence and the BID protein can also be used for treating limmunodeficiency disease (including AIDS), sensecence, neurodegenerative disease, ischemic and reperfusion cell death, infertility and wound-healing. Primers derived from the nucleic acid encoding the BID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; BH3 interacting domain death agonist; BID; BCL-2 family; apoptosis; regulation; cell death; inflammation; cancer; arthriautoimmune disease; viral infection; lymphoproliferative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polypeptides are useful in methods for modulating death of a target cell. Mutants of p15 BID, comprising an inactivating mutation in the BH3 domain, are used in methods for inhibiting death of a target cell. Agents that specifically inhibit caspase cleavage of p22 BID at the p15 cleavage site are also useful for inhibiting death of a target cell.
                                                                                                                                                                                                      Claim 4; Page 69; 118pp; English.
                                                                                                                                                                                                                                    BH3 interacting domain death agonist polypeptide - used for treating decreased apoptotic conditions resulting from inflammation etc.
                                                                                                                                                                                                                                                                                     WPI; 1998-193546/17.

                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is the mammalian Bid Bel-2 homology domain 3 (BH3) domain, which was used in a sequence alignment with the same domain of a putative version of the mammalian apoptosis regulator BBC3. Which was designated BBC3-ORF2. The BBC3 protein, nucleic acids and antibodies are suitable for use in promoting cell death or for preventing apoptosis in malignant cells and those causes.
                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                              auto1mmune

                                                                                                                                                                                                                                                                                                                                В
                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an isolated or synthetic polypeptide CC (1) comprising a less than full length amino acid sequence of a mutant CC Bcl-XL/Bcl-2 associated cell death regulator polypeptide (BAD) or its CC fragment, which contains amino acid substitutions at Seril8 of a human CC BAD, Seril5 of a murine BAD (longer murine BAD) or Seril13 of a murine BAD (longer murine BAD) or Seril13 of a murine BAD, (I) has immunostimulant, neuroprotective, CC nootropic, antischaemic, vulnerary, cytostatic, antiviral, CC antiarthritic, antiinflammatory and immunosuppressive activities, and CC can be used as an apoptosis inducer or inhibitor. BAD polypeptides and CC can be used as an apoptosis inducer or inhibitor. BAD polypeptides and CC polynucleotides can be used for screening candidate compounds and drugs for activity that promote cell survival or apoptosis. Other uses include inducing or inhibiting apoptosis in a cell. Candidate compounds inducting or inhibiting apoptosis in a cell. Candidate compounds cell immunodeficiency diseases, neurodegenerative diseases, ischaemic cell capture death, repertusion cell death, wound healing, cancer, viral infections, CC lymphoproliferative conditions, arthritis, infertility, inflammation and autolmmune diseases. The present sequence represents a Bol-family member or present invention.
                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                             The present sequence represents a BH3 interacting domain death agonist (BID) epitope given in the present invention. The protein, the DNA encoding it or antisense sequences can be used for preventing or treating a decreased apoptotic state of a cell. The decreased apoptotic state that is treated results from a disease such as cancer, viral infections, lymphoproliferative conditions, arthritis, inflammation and autoimmune diseases. Antibodies against the BID protein can be used for detecting a BID paypeptide in a cell or population of cell. The nucleic acid sequence and the BID protein can also be used for detecting disease (including AIDS), senescence, neurodegenerative disease, ischaemic and reperfusion cell death, infertility and wound-healing. Primers derived from the nucleic acid encoding the BID protein can be used for detecting/quantitating the protein and for detecting alterations in the nucleic acid encoding the BID protein can be used for detecting/quantitating the BID protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; BH3 interacting domain death agonist; BID; BCL-2 family; apoptosis; regulation; cell death; inflammation; cancer; arthritis; autoimmane disease; viral infection; lymphoproliferative.

colorectal; gastric; non-small lung; renal; thyroid; neuroblastoma; melanoma; lymphocytic leukemia; neurodegenerative disorder; AIDS; stroke; myocardial infarction.

New peptide conjugates for modulating apoptosis or for inhibiting ceil lymphoma/leukemia 2 (Bcl-2) function, especially useful for treating neurodegenerative disorders, stroke, or cancer

CC (R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached cc to the N-terminus of the peptide, or a side chain of the peptide where ct the functional group of the side chain is NH2 or OH; Or NH.

CC when the R-X group is attached to the C-terminus of the peptide where correctly considered to the R-X group is attached to the C-terminus of the peptide, or a side chain functional group is COOH CC or COOHNE; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one CC or two double bonds, cyclobutyl cyclobentyl, cyclobayl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, phenyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides ABBJOOL-BJTO58 represent examples co of the peptide portion of the conjugate. The peptides represent analogues of a Bcl-2 superfamily polypeptide corresponding to amino acids 72-97 of CC the BJJ domain of the cell death agonist Bad. The peptides conjugate is conjugate is conjugate is useful for modulating apoptosis in the cells of a subject, or for creversing B cell lymphoma/lenkenia 2 (Bcl-2) mediated blockage of apoptosis in cancer cells. It is also useful for inhibiting Bcl-2 function. In particular, the peptide conjugate is useful for treating a conjugate afflicted with a cancer characterized by cancer cells that the express Bcl-2. The cancer includes prostate, colorectal, gastric, consisted apoptosis, e.g. neurodegenerative disorders, acquired increased apoptosis, e.g. neurodegenerative disorders, acquired conjugate is also useful for treating disorders, acquired increased apoptosis, e.g. neurodegenerative disorders, acquired

The protein, the DNA encoding it or antisense sequences can be used for preventing or treating a decreased apoptotic state of a call. The decreased apoptotic state that is treated results from a disease such as cancer viral infections, lymphopooliferative conditions, arthritis, inflammation and autoimmune diseases. Antibodies against the BID protein can be used for detecting a BID polyapeptide in a cell or population of cell. The nucleic acid sequence and the BID protein can also be used for treating immunodeficiency disease (Including AIDS), sensecence, neurodegenerative disease, ischaemic and reperfusion cell death, infertility and the BID protein can be used for detecting quantitating the protein and for detecting alterations in the nucleic acid encoding the BID protein.
                                                                                                Mouse: BH3 interacting domain death agonist; BID; BCL-2 family; apoptosis; regulation; cell death; inflammation; cancer; arthritis; autoimmune disease; viral infection; lymphoproliferative.
